Generating Peptide Candidates from Protein Sequence Databases for Protein Identification via Mass Spectrometry

> Nathan Edwards Informatics Research

Protein Identification

- Turns mass spectrometry into proteomics
- Sequence is link to identity, annotation, literature, genomics
 - Proteomics workflows interrogate more than mass
 - Quality of AA sequence databases sequence & annotation varies wildly
- -Protein identification is not BLAST!

LC-MS/MS for Protein Id

LC-MS/MS for Protein Id

- -1 experiment produces 1000's of MS/MS spectra
- Suitable for complex mixtures
- -100's-1000's of proteins identified from a single experiment

-High-throughput protein identification!

Sequence Database Search Engines

- Input: Set of MS/MS spectra and associated parent ion masses
- Output: Peptide sequence for each spectrum
- 1. Generate peptide candidates from a protein or genomic sequence database
- 2. Score and rank the peptide candidates

Sequence Database Search Engines

- Input: Set of MS/MS spectra and associated parent ion masses
- Output: Peptide sequence for each spectrum
- 1. Generate peptide candidates from a protein or genomic sequence database
- 2. Score and rank the peptide candidates

Peptide Candidate Generation

Sequence $\sigma(\text{length n})$, Input: from alphabet A (Additive) mass $\mu(a)$ for a 2 A Query masses M_1, \dots, M_k All (distinct) pairs of query **Output:** masses i and subsequences ω $|\omega|$ with $\sum \mu(\omega_i) = M_i$

Peptide Candidate Generation and Peptide Id

- -Sequence databases contain many individual proteins
- -Must avoid redundant scoring

-Protein context is important

Simple Linear Scan

Output: WVTFISLLFLFSSAYSR

Sequential Linear Scan

- -O(nk) time
- Simple to implement
- Easy to track protein context
- -Poor data locality
- Redundant candidates
- String scanning problem

Simultaneous Linear Scan

Lookup each candidate mass in turn.

Simultaneous Linear Scan

- -O(k log k + n L log k) time
- Simple to implement
- Easy to track protein context
- Better data locality
- Redundant candidates
- -Now a query mass lookup problem!

Overlap Plot from a LC/MS/MS Experiment

Redundant Candidate Elimination

- Must avoid repeat scoring of the same peptide candidate
- Want to avoid generating redundant candidates
- -Non-redundant sequence databases contain lots of substring redundancy!

Substring Density (ρ)

Applied Biosystems

Redundant Candidate Elimination

-Suffix trees represent all distinct substrings of a string.

Applied Biosystems

Redundant Candidate Elimination

-Suffix trees represent all distinct substrings of a string.

AB Applied Biosystems

Suffix-Tree Traversal

- $-O(k \log k + n L \rho \log k)$ time
- -Redundancy eliminated
- Tricky to implement well
- -Memory overhead 1/4 5n
- -Protein context more involved
- -Data locality hard to quantify
- -Must preprocess sequence db
- -Still a query mass lookup problem!

Fast Query Mass Lookup

- With (small) integer weights, $O(M_{max} + k + n L \rho O)$ time is possible
- Use a query mass lookup table!
- Can we achieve this for real weights and non-uniform tolerances?

YES!

Fast Query Mass Lookup

- Must have δ \mathbf{I}_{min}
- Table size is $O(M_{max}/\delta + k I_{max}/\delta)$
- -Practical for typical parameters
- Running time: Table construction + $O(n L \rho O)$ is dominated by size of output

Observations

- Peptide candidate generation is a key subproblem.
- Must eliminate substring redundancy.
- As k increases, peptide candidate generation becomes an interval lookup problem.
- Run time dominated by output size.

Sequence Database Search Engines

- -What if peptide isn't in database?
- -Need richer set of peptide candidates
 - -Protein isoforms, sequence variants, SNPs, alternate splice forms
 - Some have phenotypic or clinical annotations

SBH-graph

ACDEFGI, ACDEFACG, DEFGEFGI

Compressed SBH-graph

ACDEFGI, ACDEFACG, DEFGEFGI

Sequence Databases & CSBH-graphs

- Sequences correspond to paths ACG EF G

ACDEFGI, ACDEFACG, DEFGEFGI Biosystems Sequence Databases & CSBH-graphs

- Complete

 All edges are on some path
 Correct

 Output path sequence only

 Compact

 No edge is used more than once
- -C³ Path Set uses all edges exactly once.

Size of C³ Path Set for k-mers

- Each path costs

 (k-1)-mer + path sequence + EOS

 Sequence database with p paths

 N_k + p k
- Minimize sequence database size by minimizing number of paths
 subject to C³ constraints

Best case senario...

...if CSBH-graph admits an Eulerian path. Sequence database size (k-1) + N_k + 1

How many paths are required if the CSBH-graph is not Eulerian?

Non-Eulerian Components

-Net degree -b(v) = # in edges - # out edges - Total degree surplus $-B_{+} = \sum_{b(v)>0} b(v)$ - For each path - Start node's net degree +1 - End node's net degree -1 - Otherwise, net degree: no change - To reduce all nodes to net degree 0, must have at least B_{+} paths.

Components w/ $B_+(C) == 0$

- -Balanced component must have Eulerian tour, so require exactly one path.
- -m balanced components

Paths Lower Bound

The C^3 path set must contain at least $B_+ + m$ paths.

This lower bound is achievable!

Just add (B₊ - 1) "restart" edges to non-Eulerian components

Achieving Path Lower Bound

Implementation

-Suitable for use by Mascot, SEQUEST, ... - FASTA format -All connection to protein context is lost - Must do exact string search to find peptides in original database

Extensions

- -Drop compactness constraint!
 - -Reuse edges rather than starting a new path
 - Similar to the
 - "Chinese Postman Problem"
 - Solvable to optimality using a network flow formulation.

Other Ideas

- We can drop correctness too!
 Equivalent to shortest substring on the set of 30-mers
- -30-mer subsets
 - ...containing two tryptic sites? ...containing Cysteine?
- -Smaller suffix-tree oracles for short queries
